TOMSK. Muchnoi-Isidorov's Institute retains 1 copybook  
TOMSK, vol. II (Transactions of the Tomsk Scientific Research Institute of Virology  
and Bacteriology), Vol. II (Tomsk, 1947-1950) 156 p., 1,700 copies  
printed.

Editorial Board: B.O. Trubnikov (Dept. Ed.); Director of the Tomsk Scientific  
Research Institute of Virology and Bacteriology; B.V. Karpov (Dept. Ed.); Professor;  
Dr. Z. Kharlamov (Secretary); M.A. Savchenko; and V.M. Poper (Deceased); Dr.  
M.I. Artobolevsky.

PURPOSE: This collection of articles is intended for biologists, physicians,  
and medical personnel.

CONTENTS: The collection contains 18 papers on problems of epidemiology and micro-  
biology and 35 reports on the theory and practice of immunology. To assist  
interpretation of names of organizations in the table of contents the following  
abbreviations will be abbreviated: Tomsk Muchnoi-Isidorov's Institute of Pathology and  
Bacteriology (Tomsk Institute); Muchnoi-Isidorov's Institute of Pathology and Bacteriology  
in Tomsk Institute; Muchnoi-Isidorov's Institute of Pathology and Bacteriology (Department of Micro-  
biology and Parasitology); Tomsk Muchnoi-Isidorov's Institute of Pathology and Bacteriology  
in Tomsk Institute; Tomsk Medical Institute; Tomsk Department of Microbiology;

Member of the Tomsk Medical Institute; Tomsk Department of Microbiology.

TITLE: Role of farm animals in free formation of Leptospira infection in man

P

SOURCE: Zhurnal mikrobiologii, epidemiologii i imunobiologii, no. 3, 1965, 142

TOPIC TAGS: animal, cow, pig, man, Leptospira, leptospirosis, animal vector study, epidemiology, serologic test, preventive medicine

ABSTRACT: During 1961-1963 at a large sovkhoz in Tyumenskaya oblast 87 cases of leptospirosis were recorded with the highest incidence among children ages 0-15 yrs. All of these children swam in a nearby river which served as a watering place for cattle and was also contaminated by manure from local pig farms. Leptospirosis in the cattle was first noted in 1961 and reached its peak in May 1962. In serologic tests specific antibodies to 11 Leptospira serotypes were found in 70% (70,3%) of the 450 cattle serums studied. The prevalent serologic types both in human and cattle serums were

L 43945-65

ACCESSION NR: AP5008021

Leptospira pomona, L. nadmodidis, and L. icterohaemorrhagiae AB, and the same types prevailed in the pig serums. It was established that farm animals play a direct causative role in the foci formation of Leptospira infection in man. Thus, a single unified medical and veterinary program is of great importance, particularly vaccination against leptospiral infection, strict animal sanitation in populated areas, and preventing leptospiral infection among agricultural workers. Orig. art. nos: None.

TITLE: Connection between the elastic deformation of oriented polymers and their structure

SOURCE: Fizika tverdogo tela, v. 6, no. 12, 1964, 3601-3607

TOPIC TAGS: polymer, oriented polymer, elastic polymer, elastic property, fibrillar structure

ABSTRACT: This is an elaboration of a preliminary report by the authors (DAN SSSR v. 153, 303, 1963). In order to disclose the details of fibrillary structure which make oriented polymers elastic, the authors studied the structural changes occurring in several oriented crystallizing polymers under elastic deformation, using x-ray diffraction methods at large and small angles. The tests were made on fibers and films made of poly-caprolactame (capron), polypropylene, polyethylene, polyethyleneterephthalate (lavan), and polyvinyl alcohol. Small-angle measurements were made with a slit type installation

Card 1/2

L 17126-65

ACCESSION NR. AP5000657

with the scattered radiation registered with scintillators, as described by the authors earlier (PTE, No. 5, 89, 1959; FTT v. 4, 2534, 1962). X-ray diffraction at large angles was measured with the URS-50 I apparatus. The x-ray measurements were made with K radiation of copper ( $\lambda = 1.54 \text{ \AA}$ ). It was found that the deformation of bundles of fibers was not due to slipping of the fibers relative to one another, but to the deformation inside the fibers themselves. The moduli of elasticity of the amorphous regions of the polymers were calculated and were found to be much lower than the moduli of elasticity of the crystal portions, up to nearly-breaking loads. The reason for this is apparently the great inhomogeneity of the distribution of the stresses over the chain molecules resulting from their disordered arrangement in the amorphous regions. It is therefore concluded that the deformation of the polymers is concentrated in the amorphous regions, which should be further investigated. Orig. art. has: 5 figures and 2 tables.

Avtomatizatsiya kak sredstvo ozdorovleniya usloviy truda (Improved  
Working Conditions Through Automation) [Moscow] Profizdat, 1958.  
71 p. 5,000 copies printed.

Ed.: I.S. Denisova; Tech. Ed.: A.A. Golichenkova.

PURPOSE: This booklet is intended for personnel responsible for  
safety engineering.

COVERAGE: The booklet describes simple mechanization and automation  
methods, that if used by individual plants may significantly  
reduce working hazards in casting, cutting, and forming metals and  
processing chemicals. Examples showing instrumentation of machine  
tools and other equipment with various feeders, loaders, and other  
safety devices are included. No personalities are mentioned.

TITLE:

The Soviet Phytotron (Sovetskiy fitotron)

PERIODICAL:

Nauka i zhizn', 1958, Nr 11, pp 33-35 (USSR)

ABSTRACT:

A new center of Soviet biological sciences is the station for artificial climate of the Institut fiziologii rasteniy imeni K.A. Timiryazeva Akademii nauk SSSR (Institute of the Physiology of Plants imeni K.A. Timiryazev of the USSR Academy of Sciences), established a few years ago. This station for artificial climate or phytotron, as it is called, consists of a number of laboratories which provide facilities for the creation of any climatic conditions. The author gives a detailed description of his visit to the Corresponding Member of the USSR Academy of Sciences, I.I. Tumanov, Head of the Institute, and mentions the research done in this field of the phytotron by the following scientists: M.K. Bardinskaya, Academician L.A. Kursanov, P.A. Genkel', Professor, K.A. Badanova, Scientific Co-Worker and Professor Z.O. Zhurbitskiy. There are 4 photos.

TITLE: Hydrofining of Lubricants

PERIODICAL: Khimiya i tekhnologiya topliv i masel, 1961, No. 4,  
pp. 27-31

TEXT: Lubricants produced at modern refineries running on  
eastern high-sulphur crudes are finished with earth but the  
lubricants obtained are not of satisfactory quality, particularly  
in respect of colour, and the yield is low. Accordingly, VNII NP  
and GrozNII have investigated catalytic refining of lubricants in  
the presence of hydrogen (hydrofining) to replace earth treatment.  
Various distillate and residual lubricating oils produced from  
sulphurous crudes by phenol and furfural extraction were hydro-  
fined under laboratory conditions. The work showed that hydro-  
fining with aluminium-cobalt-molybdenum catalyst considerably  
improved the colour, somewhat improved the viscosity index and

Card 1/5

S/065/61/000/004/004/011  
E194/E284

### Hydrofining of Lubricants

oxidation stability and reduced the coke number. There was some reduction in viscosity and increase in pour point. Depending upon the properties of the feed the output of hydrofined oil was 98-99.5%. The Novokuybyshevskiy neftepererabatyvayushchiy zavod (Novokuybyshevsk refinery), together with the Kuybyshev NII NP organized a plant trial on hydrofining of various de-waxed lubri-

The lubricating oils were hydrofined on a reconstructed plant for hydrofining of diesel fuel. Tests were made on two distillates, one a spindle and the other a machine oil, and one residual oil. The de-waxed feed passed to heat exchangers where it was heated by finished oil issuing from the reactor and was then finally heated to temperature in a furnace before passing to the reactor. Before entering the furnace the feed was mixed with hydrogen containing gas and was then passed to the top of columns loaded with aluminium-cobalt-molybdenum catalyst. On leaving the column the product passed through the heat exchangers, thence to a gas

Card 2/5

E194/E284

### Hydrofining of Lubricants

separator and the finished product was vacuum stripped. The main characteristics of the catalyst are given. The oils produced were spindle oil, machine oil and residual oil with viscosity of 20.66 centistokes at 100°C. The results of hydrofining and of earth treatment are compared in Table 3. It will be seen that the hydrofined oils have much better colour, lower coke number, lower sulphur content, higher viscosity index but that there is some loss of viscosity and 1-2° higher pour point. Preliminary technical and economic calculations indicate that the capital costs of constructing hydrofining and earth treatment plant is about the same but with hydrofining running costs are about 32% less than with clay treatment. There are 1 figure and 3 tables.

TITLE: Effect of the extent of refining<sup>11</sup> of the distillate and residual components of DS-14 oil from sulfurous petroleum upon their operational properties B

SOURCE: Ref. zh. Khimiya, Abs. 19Pl29

REF SOURCE: Tr. Kuybyshevsk. n.-i. in-t naft. prom-sti, vyp. 25, 1964, 85-95

TOPIC TAGS: lubricating oil, petroleum refining, phenol / DS-14 lubricating oil, MS-20 lubricating oil, DS-11 lubricating oil

ABSTRACT: Laboratory study and testing on the engine YaMZ-204 of five samples of DS-14 oil of Novokuybyshev NPZ (differing by the technology of their processing) have been performed. The study shows that the changes in the extent of phenolic refining of distillate and residual components (within the limits of 160—180 and 250—320% of phenol, respectively) have no effect on the detergency, antioxidative, and anti-wear properties of DS-14 oil containing effective additives. Economically, the most convenient method for producing DS-14 oil is to mix the residual and distillate components of Diesel oil, 60 and 40%, respectively, (i.e., components treated to a less extensive phenolic refining). This leads to lowering the price of DS-14 oil by 15% and to increasing its yield by 4%, as compared with the production of DS-14 oil by mixing oils MS-20 and DS-11. A. N. [Translation of abstract]

"Changes in the Potential of Wheat Roots in the Presence of Aluminum and Phosphate Ions," S. N. Aleshin, N. T. Yastrebov, Moscow Agr Acad imeni K. A. Timiryazev, 2 pp.

"Dok Ak Nauk SSSR" Vol LXX, No 3

Authors use apparatus and method they described in previous work to determine potential on roots of living plants. Determined and tabulated changes in magnitude and sign of potential on surface of 5-7 cm wheat rootlets when placed in 0.02 M phosphate buffer solutions of various pH, washed in distilled water, put into 0.001 M solution of aluminum chloride for 10 min, and then replaced in second phosphate solution for 30 min. In first series, sign changed from positive to negative with increased pH, in the second it was positive, and in the third it required higher pH to return to negative. Submitted 25 Nov 49.

compensating potentiometer with a mirror galvanometer with a sensitivity of  $10^{-8}$ a. After a thorough washing, the rootlets being studied were cut off and used without delay for the measurement of the electric charge. Potential was determined in the course of 4-5 minutes. The action of the active soil acidity (of hydrogen ions) on plant roots leads to the formation of an electrical charge in the protein which determines to a considerable degree the initial stage of the absorption of the anion or cation forms of nutrient elements. With the reaction of the medium of pH 5.3 and especially of pH 4.1 a considerable lowering of the magnitude of the negative charge of strawberry root surface to -5.9 millivolts takes place which promotes a better absorption of N in anion form (of the nitrate anion); with the reaction of a medium of pH 7.3, the negative charge of the strawberry root surface increased to 15.3 millivolts contributing to the

Card 2/3

USSR/Cultivated Plants - Fruits. Berries.

M

Abs Jour : Ref Zhur Biol., No 18, 1958, 82522

predominating absorption of N in the form of cation (an ammonium cation). Better absorption of nitrate N with a mildly acid reaction of the medium (pH 5.5) promoted the synthesis of proteins and carbons in the plants. As the result, the sugar content in ripe fruit comprised about 80% against 60% with ammonium N. Under the conditions of a mildly alkaline reaction of the medium (pH 7.3-7.5) the sugar content proved to be higher with the ammonium feeding - 62.6% against 50.4% with the nitrate feeding. On strongly acid soil (pH 4.3) application of humus secured the greatest sugar content in the fruit. The aggregate level of sugar in fruit increased to the degree of the increase in soil acidity. -- Ye.V. Kolesnikov

TITLE:

Natural Radioactivity of Zonal Soils of the European Part of the USSR (Yestestvennaya radioaktivnost' zonal'nykh pochv Evropeyskoy chasti SSSR)

PERIODICAL:

Doklady Akademii Nauk SSSR, 1958, Vol. 119, Nr 3,  
pp. 586-589 (USSR)

ABSTRACT:

Scientists succeeded in finding a direct correlative interdependence between the values of natural radioactivity of the soils (nRS) and their fertility (References 1,2,10,11,13). The possible favorable influence of the weak radiations of natural radioactivity (within the optimum range) on biochemical and chemical reactions of the plants and microorganisms in the soil were underestimated. This happened because this radioactivity was regarded only as a certain heat effect which compared to the radiation of the sun is only very small. However, the effect of radiation has a specific qualitative character which becomes mainly apparent in the atomic and molecular ionization. This probably leads to the increase of the reaction power.

Card 1/4

Natural Radioactivity of Zonal Soils of the  
European Part of the USSR

20-119-3-55/65

of the latter with respect to biochemical and chemical reactions (References 12, 15). This does not mean that already today it may be recommended to introduce radioactive materials into the ground (References 4,7) since years of precise investigations are still necessary for this. (References 3,9,14). Most of the scientists up to now have been of opinion that the nRS is exclusively due to the presence of the radioactive elements: Tb, U, Ra, K<sup>40</sup>, C<sup>14</sup> and others. According to new discoveries however, it must be assumed that the nRS also depends to a certain degree on the action of cosmic factors (References 5,6,16). In the present paper results of determinations of the total nRS at characteristic points of natural zones along the meridian from Moscow to the southern coast of the Crimea are mentioned. According to data on table 1 the total nRS increases toward the direction mentioned last. This is in direct correlative interdependence between the amount of the total radiation due to the content of Th, U, Ra, K<sup>40</sup> and C<sup>14</sup> in the soils on this meridian:

Card 2/4

Natural Radioactivity of Zonal Soils of the  
European Part of the USSR

20-119-3-55/65

a) meadow podsol, b) meadow - steppe - soil heavy black earth, c) normal black earth, d) brown forest soil of the semi-dry subtropics of the Crimea (References 1,2). Moreover, a dependence on the sun radiation increasing toward the south is given (Reference 8). Thus, the mentioned soils could be provisionally placed in the mentioned order according to the increasing total nRS. A most important fact was discovered: In all moderately moist soil samples which evaporated water during the determination the total nRS was much higher than in samples with dry air (Table 2). From this fact the author concludes that in the phenomenon of the nRS a great rôle is attributed to water and a certain role also to cosmic factors.

There are 2 tables and 16 references, 15 of which are Soviet.

TITLE:

Determination of Radioactivity of Soil- and Atmosphere Air Marked With  $C^{14}O_2$ , in Order to Control the Purity of Soil Air Samples (Opredeleniye radioaktivnosti pochvennogo i atmosfernogo vozdukha, mechenno go  $C^{14}O_2$ , dlya kontrolya chistoty prob pochvennogo vozdukha)

PERIODICAL:

Doklady Akademii Nauk SSSR, 1958, Vol. 119, Nr. 4,  
pp. 792-795 (USSR)

ABSTRACT:

It is known that the plant photosynthesis, the decomposition of the organic radical by microorganisms, and the synthesis of the humic substances in the soil are closely connected with the composition and the supply of the soil air. Much more attention is to be paid to the soil air beside the solid and liquid phase of the soil than has hitherto been done (references 1, 2). The determination of the air composition according to single genetic soil horizons demanded the application of probes and needles of different construction (references 3 - 7).

Determination of Radioactivity of Soil- and Atmosphere 20-119-4-46/60  
Air Marked With C<sup>14</sup>O<sub>2</sub>, in Order to Control the Purity  
of Soil Air Samples

The needle suggested by the author is simple and makes possible the taking of samples of soil air from a depth of 15 - 20 cm on without atmospheric air. In consequence of critical remarks of several researchers (references 5, 8, 9) concerning the soil probes, the author tested the reliability of his needle(reference 7) by use of C<sup>14</sup>O<sub>2</sub>. Table 1 gives the properties of the single soils. The taking of the air was carried out under a glass bell filled with C<sup>14</sup>O<sub>2</sub>. The measuring results of the radioactivity are compiled in table 2. They show that the radioactivity of the soil air from a soil above, which there was pure air, did not differ from that of soil air from a soil which for about two minutes was covered by a glass bell filled with radioactive C<sup>14</sup>O<sub>2</sub>. The radioactivity of the marked air exceeded here that of the soil air by the 21 - 43 fold. By this the application of the needle suggested by the author proved to be reliable, since the soil air did not contain atmospheric air, even if it was taken from a low depth

(20 cm). Finally the radioactivity for the single soil types per 1 m<sup>3</sup> is calculated. Corresponding Member, Academy of Sciences, USSR, V. A. Kovda took part in the works. There are 2 figures, 2 tables, and 11 references, 10 of which are Soviet.
